## Github

- <https://github.com/ravichas/ML-TC1>

# Introduction

- **This is part of the NCI-DOE knowledge/capability transfer efforts**
- **Share tools/techniques/solutions for cancer related problems. We often take a test-case and show how it works**
- **You would be able to take the test-case (code/scripts) and tune it to your needs**
- **We want to hear from you, please send us your feed-back**

# Motivation: Cancer Prediction vs Cancer Detection

- **Cancer Prediction has been the major focus**
  - Prognosis, Recurrence, Susceptibility
- **Cancer Detection (classification of tumors/cancers) is lagging behind Prediction and we would like to share an application that might be useful**
  - Detect/Identify cancer type at an early stage

## Goal(s)/Questions

- **Take genomic expression data from tumor/cancer samples and apply Deep-Learning to create cancer types/site(s) classifier models**
- **Are the expression profiles unique?**
- **Can we use the model as early cancer type detection**
  - Improving chance of early detection cure/survival?

# Cancer Burden

- **Cancer is a group of diseases with world-wide risk**
- **Acquired or somatic changes causes 90-95% of cancer (all types)**
  - Source TCGA
- **~ 200 forms of cancer**
  - DOI: 10.5114/wo.2014.47136
- **For 2020**
  - ~1.8M new cancer cases are expected
  - ~600K deaths will occur

Figure from Genomic Data Commons

# Expected New Cases/Deaths in 2020

## New Cancer Cases

Between 2010 and 2020, we expect the number of new cancer cases in the United States to go up about 24% in men to more than 1 million cases per year, and by about 21% in women to more than 900,000 cases per year.

US population gender	Cancers that are expected to increase
Men	Prostrate, Kidney, Liver and Bladder
Women	Lung, Breast, Uterine and Thyroid

# Dynamic genomic changes result in Cancer

Somatic alterations in oncogenes are the source of Transcript alterations

## Article

### Genomic basis for RNA alterations in cancer

<https://doi.org/10.1038/s41586-020-1970-0>

Received: 29 March 2018

Accepted: 11 December 2019

Published online: 5 February 2020

Transcript alterations often result from somatic changes in cancer genomes. Various forms of RNA alterations have been described in cancer, including overexpression, altered splicing and gene fusions; however, it is difficult to attribute these to underlying genomic changes owing to heterogeneity among patients and tumor types, and the relatively small cohorts of patients for whom samples have been analyzed by both transcriptome and whole-genome sequencing.

## PERSPECTIVE

# Understanding Genotype-Phenotype Effects in Cancer via Network Approaches

Yoo-Ah Kim, Dong-Yeon Cho, Teresa M. Przytycka\*

National Center for Biotechnology Information, National Library of Medicine, National Institutes of Health, Bethesda, Maryland, United States of America

\* [przytyck@ncbi.nlm.nih.gov](mailto:przytyck@ncbi.nlm.nih.gov)

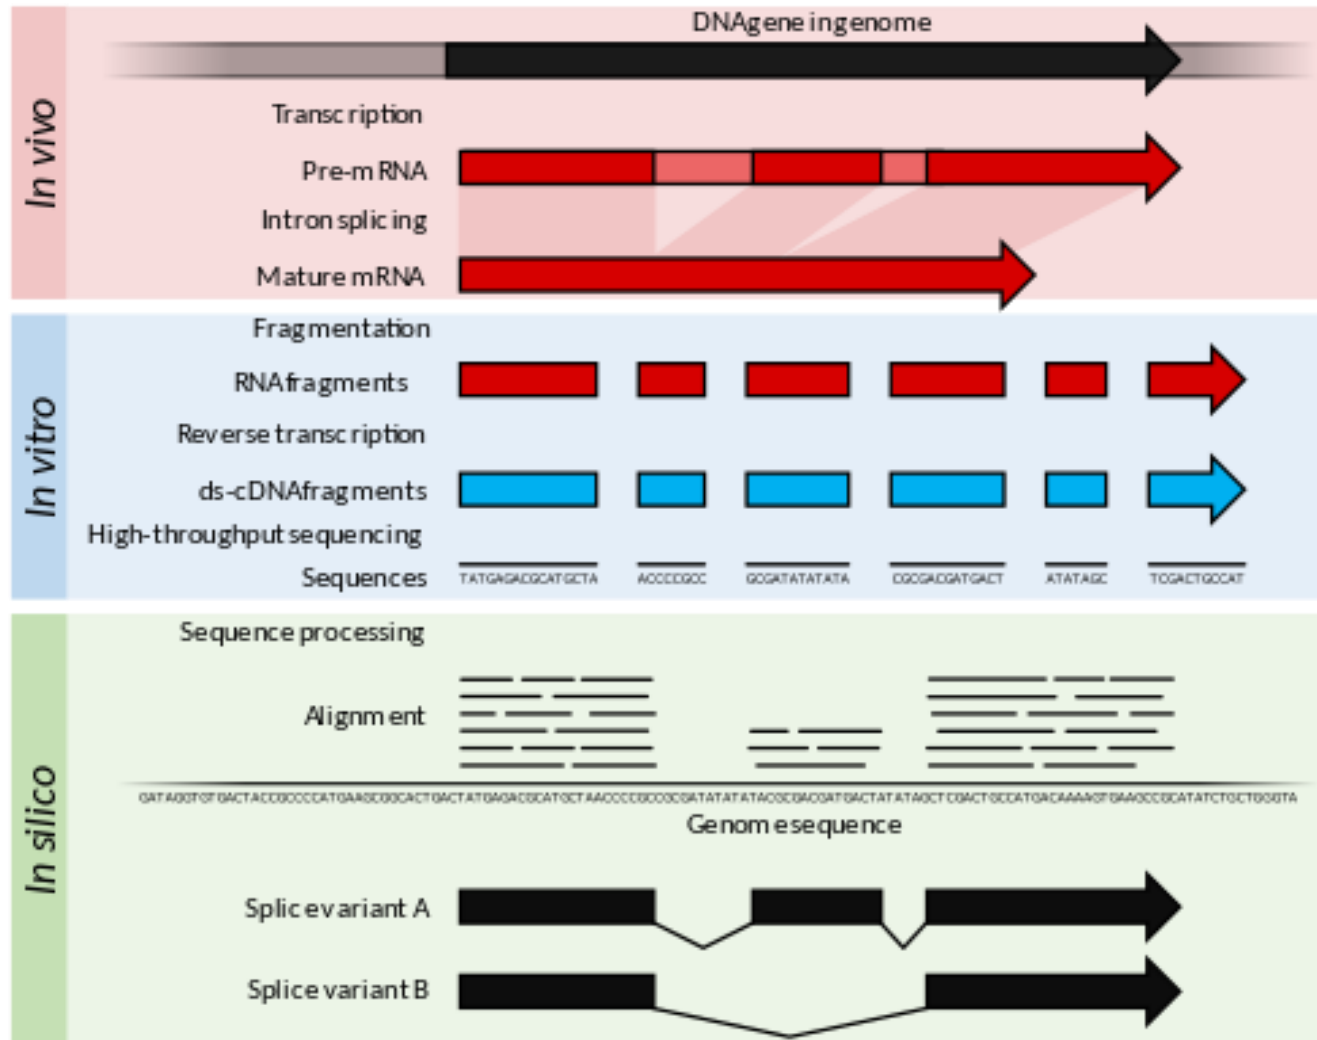

## Author Summary

Cancer is now increasingly studied from the perspective of dysregulated pathways, rather than as a disease resulting from mutations of individual genes. A pathway-centric view acknowledges the heterogeneity between genomic profiles from different cancer patients while assuming that the mutated genes are likely to belong to the same pathway and cause similar disease phenotypes. Indeed, network-centric approaches have proven to be helpful for finding genotypic causes of diseases, classifying disease subtypes, and identifying drug targets. In this review, we discuss how networks can be used to help understand patient-to-patient variations and how one can leverage this variability to elucidate interactions between cancer drivers.

READS

## Data source: The Cancer Genome Atlas (TCGA)

- NIH launched TCGA Pilot Project – a public funded project
- Goal of creating a comprehensive “atlas” of cancer genomic profiles.
- Large cohorts of over 30 human tumors through large-scale genome sequencing and integrated multi-dimensional analyses.
- Contains Microarray and NGS data
  - RNASeq
  - miRNA seq
  - SNP based platforms
  - .....
- TCGA data is available via GDC

<https://www.cancer.gov/about-nci/organization/ccg/research/structural-genomics/tcga>

# Data Harmonization: GDC ( <https://gdc.cancer.gov/> )

- Data and metadata is submitted to the GDC in standard data types and file formats. Other data sources (Ex. TCGA) are also included
- Data are harmonized against a common reference genome (GRCh38)
- For this workshop, we will focus on TCGA Genomic expression data from GDC

# Expression Data Quantification

- $RC_g$ : Number of reads mapped to the gene
- $RC_{g75}$ : The 75th percentile read count value for genes in the sample
- $L$ : Length of the gene in base pairs; Calculated as the sum of all exons in a gene

$$FPKM-UQ = \frac{RC_g \times 10^9}{RC_{g75} \times L}$$

# Quantifying mRNA abundance and Scaling

- GDC harmonization data is provided in FPKM-UQ
- In our code, FPKM-UQ is rescaled to TPM using the following formula.

$$\text{TPM}_i = \left( \frac{\text{FPKM}_i}{\sum_j \text{FPKM}_j} \right) \cdot 10^6$$

- TPM has nice mathematical properties and a stable entity

# Data preparation steps summary

## Before we break for hands-on

- **Python as the programming language for this workshop, but similar libraries are available in R or other languages**

- **Will use Jupyter Notebook for sharing the code**
  - With little effort one can convert the Python code into R and still use Jupyter Notebook

## To be continued after hands-on

---

<https://github.com/ravichas/ML-TC1>

## Before we begin the modeling section ...

- Due to lack of time, I won't be covering the basics of Neural Network

*Keras is a high-level NN package that is built on top of popular high-level libraries (TF, Theano). Works well with CPU/GPU*

These are good books for beginners and up

Figure from Deep Learning with Python

# Supervised Learning

- Goal
  - Construct a model that takes in input features/target pair to return a prediction for target/outcome
- Train a machine learning
  - Model refers to learning its parameters, which typically involves minimizing a loss function on training data with the aim of making accurate predictions on unseen (test) data

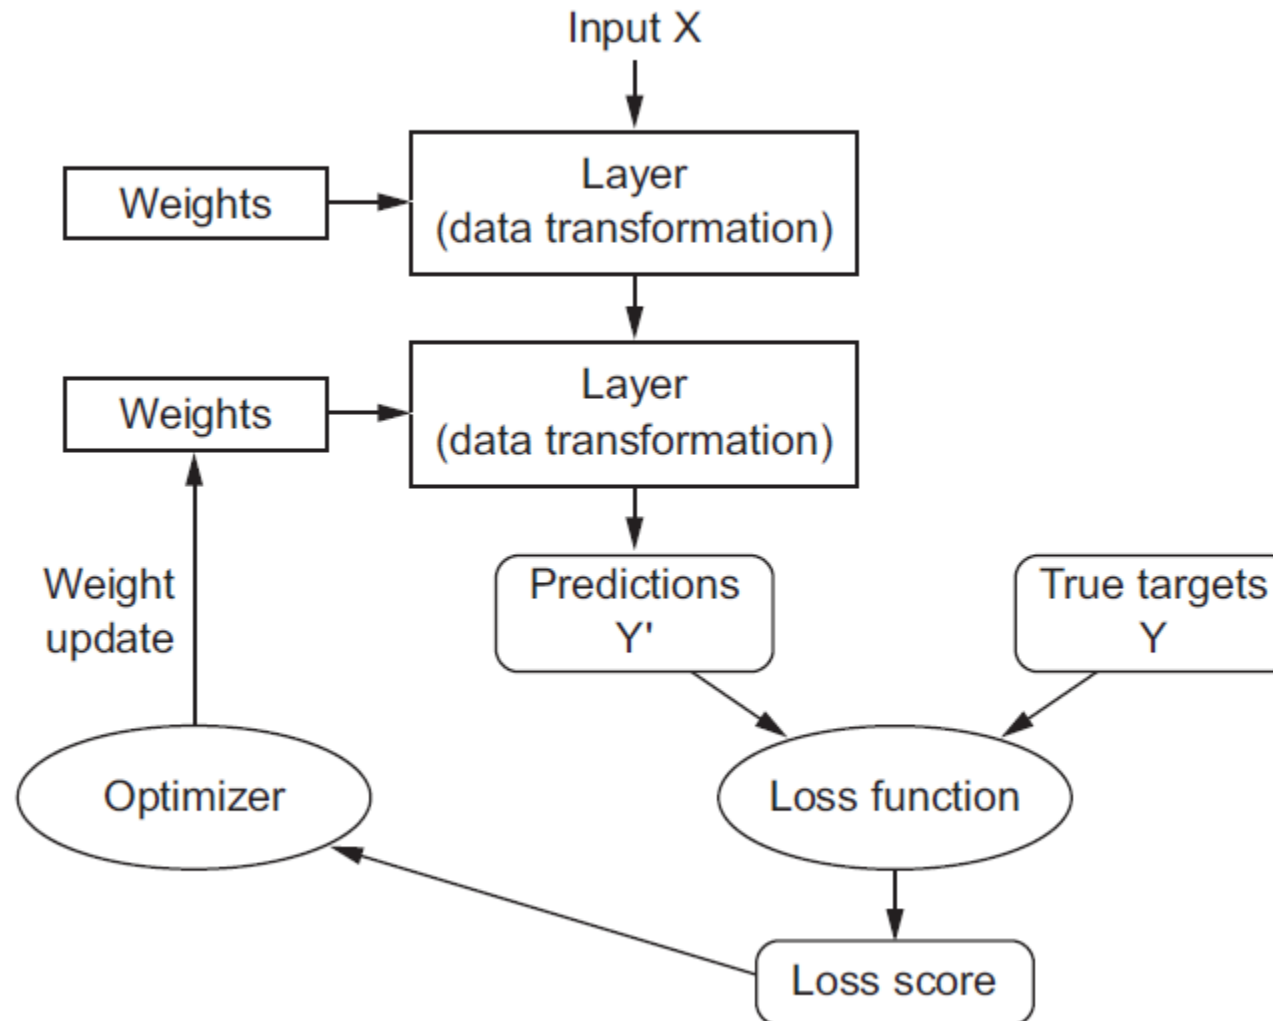

## Supervised Learning:

Data:  $(x,y)$  ; where  $x$  is the genomic expression profile ;  $y$  is the cancer classes

Goal? Learn the function that maps  
 $x \rightarrow y$

# Deep Learning Procedure

# A Simple Network

Input	Output
0.125	0.39
0.25	0.40
0.5	0.43
1	0.48
2	0.58
3	???

Data based on Mary Attenborough, in [Mathematics for Electrical Engineering and Computing](#), 2003

# What is different about Neural Network?

- If you know the equation (algorithm), then you feed in the **input** and you get the **output**.  
You can code the function yourself

```
def function(m):  
    L = 0.1 * m + 0.38  
    return(L)
```

- You can choose to use linear modeling and use the data to figure the relationship

```
Model ← lm( L ~ m)
```

- Neural Network using the data learn the algorithm.

**INPUT**

**ALGORITHM**

**OUTPUT**

# A Simple Network

**Input: Mass or  $M$  (kg)**  
**Output: Length or  $L$  (m)**

M	L
Input	Output
0.125	0.39
0.25	0.40
0.5	0.43
1	0.48
2	0.58
3	???

Hidden Layer

M	L
0.125	0.39
0.25	0.40
0.5	0.43
1	0.48
2	0.58
3	0.68

These are the model variables: `[array([[0.10058284]], dtype=float32), array([0.37793916], dtype=float32)]`

Based on Mary Attenborough, in [Mathematics for Electrical Engineering and Computing](#), 2003

# Error minimization

- Goal is to choose  $W$ s such that predictions of the network should be close to  $y$
- Error function or cost function a measure how good our predictions are
- Eventually, we want to pick a set of  $w$  that minimizes the error function

# Convolutional Neural Network

- We are going to take a vector of genomic expression values and feed them into a network with a series of operations to create a model
- Model is what we call convolutional-1D network

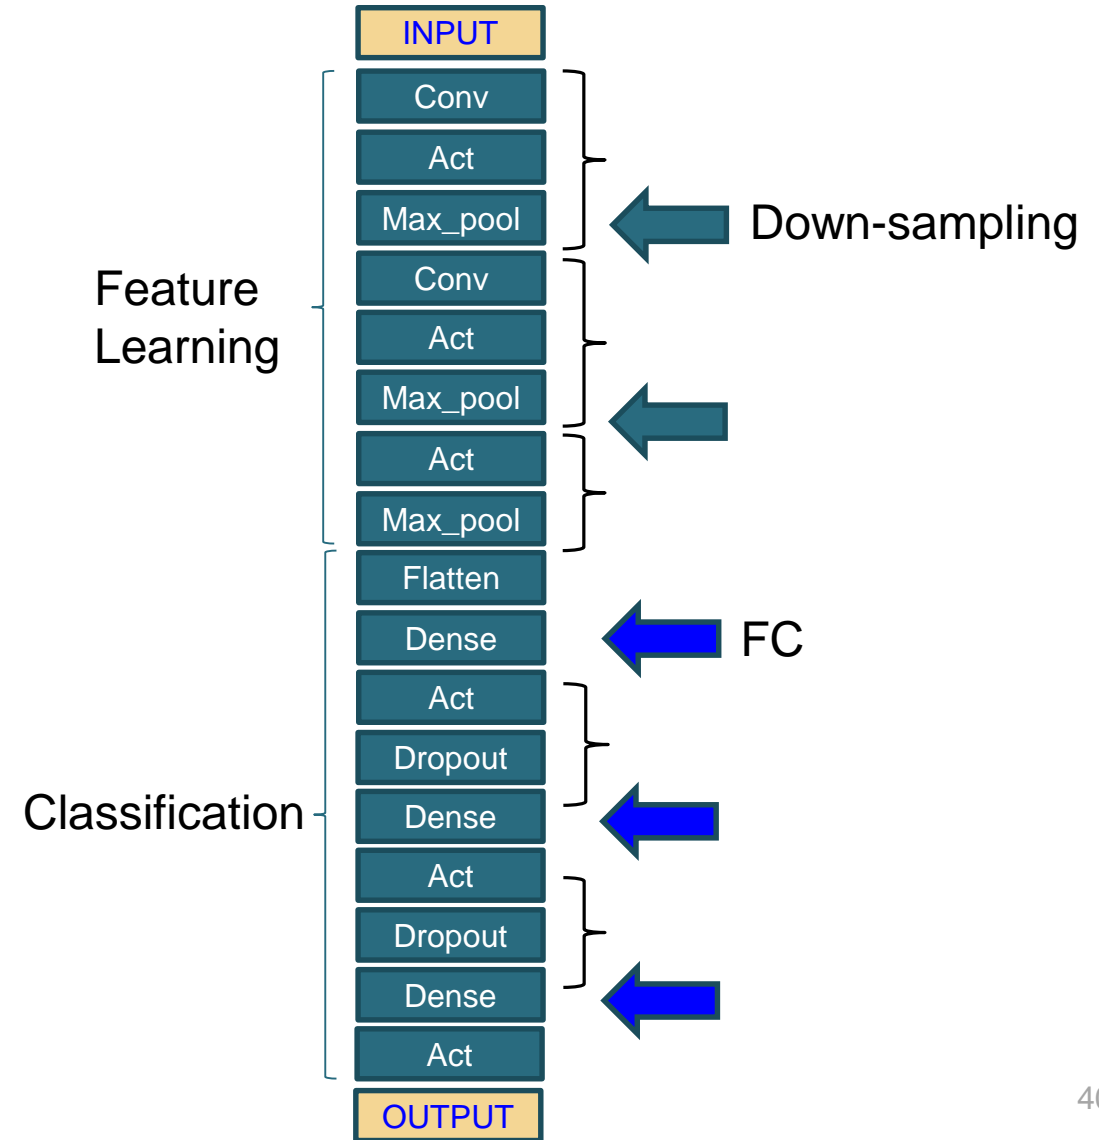

# Components of conv1D

1. Activation (Act)
2. Convolution (Conv)
3. Maxpooling (Max\_pool)
4. Flatten
5. Dense
6. Dropout

Topology of a network defines a “hypothesis space”

Choosing a specific topology is usually not straightforward and comes with practice.

# 1. Activation Function

- Activation functions are included to create non-linearity

[This Photo](#) by Unknown Author is licensed under [CC BY-SA](#)

- Sigmoid
- ReLU
- Leaky ReLU
- ELU
- Maxout
- Tanh

Squashes the #s to [0, 1]

# 1. Activation function

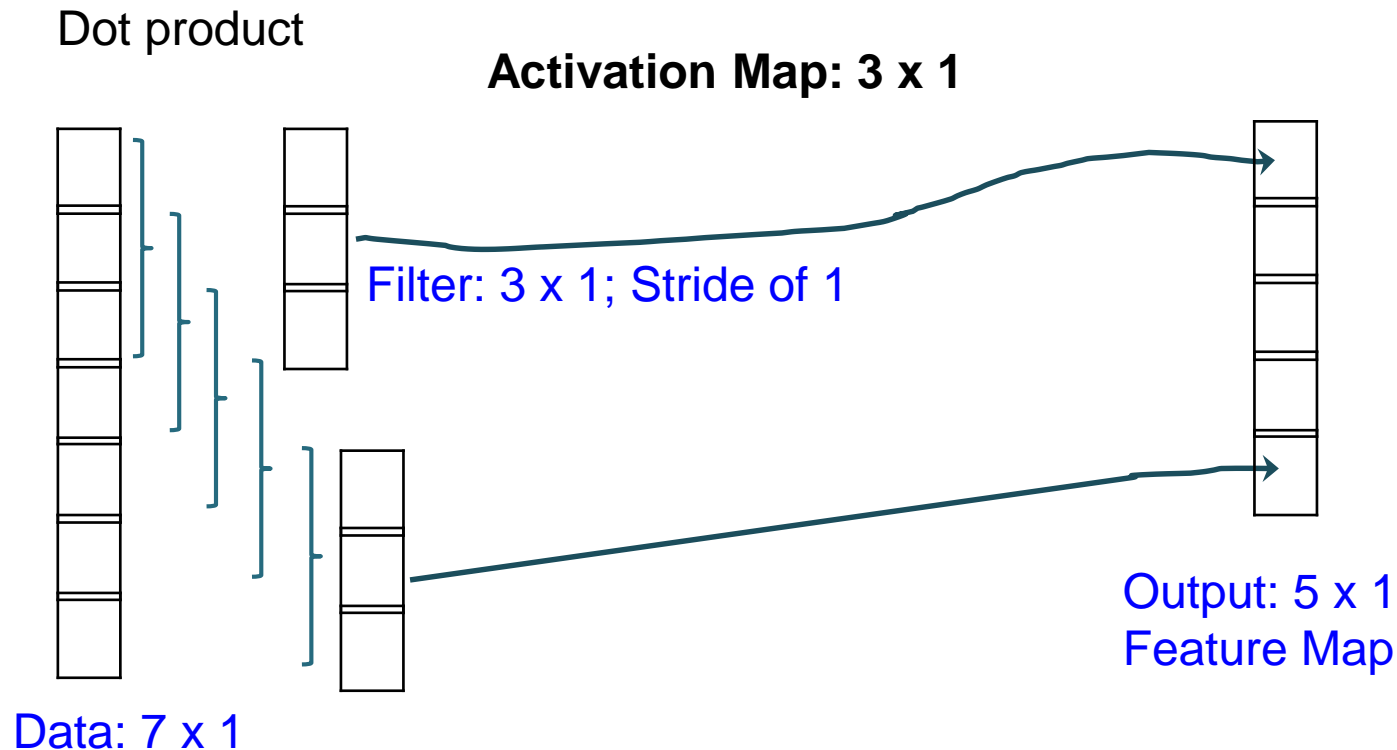

$$a^{(L)} = \sigma(w^{(L)}a^{(L-1)} + b^{(L)})$$

$$\sigma \left( \begin{bmatrix} W_{0,0} & W_{0,1} & \dots & W_{0,n} \\ W_{1,0} & W_{1,1} & \dots & W_{1,n} \\ \vdots & \vdots & \ddots & \vdots \\ W_{k,0} & W_{k,1} & \dots & W_{k,n} \end{bmatrix} \begin{bmatrix} a_0^{(0)} \\ a_1^{(0)} \\ \vdots \\ a_n^{(0)} \end{bmatrix} + \begin{bmatrix} b_0 \\ b_1 \\ \vdots \\ b_n \end{bmatrix} \right)$$

## 2. Convolution

Process of applying filter (kernel) to the data for the purpose of subsampling. Kernel is a matrix that has a smaller dimension than the input data creates chunks

Reduces the number of parameters and allow creation of deeper networks

Convolutional Layer

# of HP

- # of filters
- Spatial Extent
- Stride
- Amount of zero padding

### 3. Pooling

- Pooling makes the representations smaller/manageable (downsampling) by retaining only important features; creates smaller clusters of manageable size
- Each activation map will be pooled separately.
- Common approach is Max Pooling

Max-pooling  
with filter size  
of 2x1 and  
stride of 2

#### Max Pooling Intuition:

Enhancing the signals by looking at a region and pick the maximum activation value

Each of these are activation and we are looking for

Research shows that zero-padding is not followed.  
Because we are interested in down-sampling

## 4. Flatten

**Procedure to transform a 2D matrix (features) to a 1D vector which in turn can be fed into a fully-connected layer (dense)**

## 5. Dense

Each neuron receives input from all the neurons in the previous layer (densely connected)

[This Photo](#) by Unknown Author is licensed under [CC BY-NC](#)

## 6. Dropout

**Imbalance in the weights among the nodes can lead to some node weights not contributing to the learning**

**One solution:  
Remove a random proportion of selection of neurons in a neural network during training**

**Can help weak learners become strong learners**

## 6. Dropout
